

# Year 7 Knowledge Organiser - Transformations

## Objectives

Solve geometrical problems on coordinate axes

Identify, describe and construct congruent shapes, including on coordinate axes, by considering rotation, reflection and translation

Describe translations as 2D vectors

Identify, describe and construct congruent shapes, including on coordinate axes, by considering rotation, reflection and translation

## Key Vocabulary

**Congruent** – two figures or objects are congruent if they have the same shape and size, or if one has the same shape and size as the mirror image of the other

**Rotation** – the motion of a shape around a fixed point

**Reflection** – an image of a shape as it would be seen in a mirror

**Translation** – transformation that moves every point of a figure or a space by the same distance in a given direction

**Vector** – describes movement from one point to another. They have both direction and magnitude (size)

### Reflect horizontally/vertically (1)

### Reflect horizontally/vertically (2)

### Reflect Diagonally (1)

Reflection in the line  $y=0$  – this is also a reflection in the line  $x=0$

### Reflect Diagonally (2)

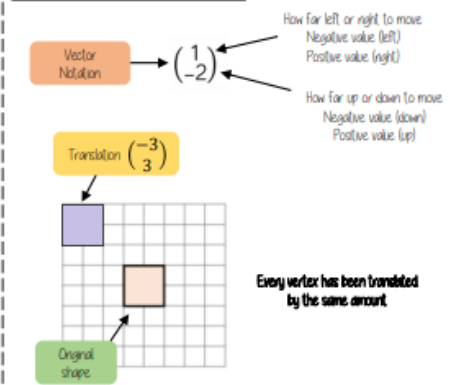

**Lines parallel to the x and y axis**  
REMEMBER  
Lines parallel to the x-axis are  $y = \dots$   
Lines parallel to the y-axis are  $x = \dots$

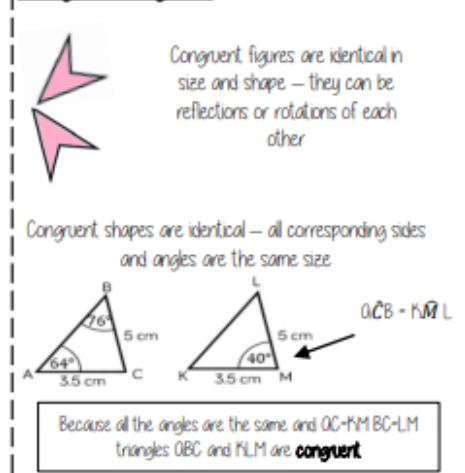

## Rotational Symmetry

## Translation and vector notation

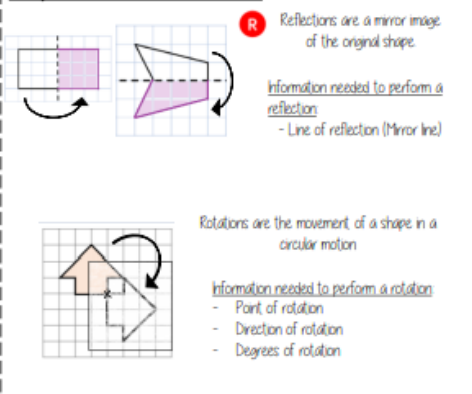

## Congruent figures

## Rotate from a point (in a shape)

## Compare rotations and reflections

## Rotate from a point (outside a shape)

## Coordinates in four quadrants
